Aptos Labs Hiring Team,

I am applying for the Staff Software Engineer, Product role because it sits exactly where my strongest work has been: building Web3 products that developers and real users can actually use, across wallets, SDKs, APIs, trading flows, and consumer-facing interfaces. I have been working from the Solana side of the ecosystem, but the product problems in this role are the same ones I solve every day: make complex on-chain actions understandable, reliable, and safe enough for people to trust.

I solo-built and operate SolPulse, a production Solana trading platform live on web, iOS, Android, and the Solana dApp Store with 350+ users. It is not a demo app. It handles real capital, which forced me to care about the parts of product engineering that usually decide whether a Web3 app survives contact with users: transaction state, idempotency, failed quotes, race conditions, stale market data, wallet approval UX, mobile constraints, and clear recovery paths when infrastructure is slow or inconsistent.

The other side of my work is developer infrastructure. I wrote the first Mobile Wallet Adapter 2.0 SDK for Cocos Creator and the first production-ready Unreal Engine 5 MWA plugin, both verified on Solana Seeker hardware. I also shipped SDK work across Unity, Godot, Capacitor, and iOS-native signing, and landed multiple upstream fixes in public Solana SDKs after finding integration issues through real device testing.

That mix maps closely to Aptos' product team. You are looking for someone who can build Web3 applications and tools across dApps, wallets, SDKs, APIs, standards, and protocols while still caring about the quality of the user-facing experience. My day-to-day stack is TypeScript, React, Node, Postgres, Redis, WebSockets, and on-chain APIs, but the more important pattern is ownership: I design the interface, build the backend, integrate wallets and signing, debug production behavior, and keep iterating until the flow is reliable for users.

I would be excited to help Aptos build developer and consumer products that make decentralized assets feel safer, faster, and more usable. Thank you for taking the time to review my application.

Best,
Mathew Stevens
