Blockchain.com Mobile Team

Dear Blockchain.com Mobile Team,

I am applying for the Senior React Native Engineer role because Blockchain.com is working on the kind of mobile crypto product surface I know well: wallet-native experiences, trading flows, reusable architecture, and reliable consumer applications around real digital assets.

I built and operate SolPulse, a live Solana trading platform across web, iOS, Android, and the Solana dApp Store with 350+ users. It includes real-time execution, WebSockets/SSE, PostgreSQL, Prisma, Redis, multi-DEX routing, priority-fee controls, token intelligence, and layered risk systems around live capital. That experience maps closely to Blockchain.com's mobile direction: building fast, trustworthy applications where auth, wallet, trading, data, and execution flows have to work together cleanly.

The role's focus on modular mobile architecture is especially compelling. Across SolPulse and my wallet SDK work, I have had to separate reusable signing, wallet, transaction, data, and UI responsibilities so they can be used across different platforms and product surfaces. I have shipped Solana Mobile Wallet Adapter tooling across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS flows, including first-of-their-kind SDKs verified on Solana Seeker hardware. That work required careful API boundaries, compatibility testing across real wallets, clear contracts between modules, and production-grade handling of signing and authentication flows.

My strongest daily stack is TypeScript, React, Node, PostgreSQL, Redis, and mobile wallet infrastructure. I have also worked across Swift, Kotlin, C++, C#, and cross-platform mobile/plugin environments. While my deepest shipped mobile production work has not been a pure React Native app, the architecture problems Blockchain.com describes are the problems I have been solving directly: shared modules, secure wallet flows, backend API integration, app-store-ready mobile UX, and reliable behavior under real user pressure.

I also use AI-assisted development tools heavily, including Codex and Claude, but I treat them as accelerators rather than substitutes for engineering judgment. In systems that touch wallets, keys, trading, and user funds, generated code still needs strict review, clear state handling, strong typing, and careful production validation.

What attracts me to Blockchain.com is the chance to help build mobile infrastructure that can support many new crypto experiences without rebuilding the same wallet, trading, auth, and on-ramp primitives each time. I would bring strong TypeScript/product engineering, production crypto experience, mobile wallet depth, and a practical reliability mindset from operating live systems with real users and real capital.

I would be excited to help Blockchain.com evolve its mobile architecture and ship high-quality crypto applications across iOS and Android.

Sincerely,

Mathew Stevens
