CoW DAO Hiring Team

Re: Staff Backend Engineer (Rust)

Dear CoW DAO team,

I am excited to apply for the Staff Backend Engineer role because CoW DAO is working on one of the hardest and most important problems in DeFi: making trade execution more reliable, transparent, and protected from harmful MEV. I have spent the last year building and operating SolPulse, a live Solana trading platform where execution quality, transaction reliability, and user trust directly matter because real capital is involved.

As the sole engineer behind SolPulse, I designed the trading system across web, iOS, Android, and the Solana dApp Store. The platform supports sniper entries, DCA, limit orders, smart TP/SL exits, multi-DEX swap routing, priority-fee controls, token intelligence, and layered risk controls. The execution engine was built around practical failure modes: race conditions, idempotency, missed-trade versus bad-trade tradeoffs, stale market data, provider reliability, and observability under live load. It was designed to support 1,200 concurrent transactions at 10ms monitoring while keeping user safety and risk limits in front of speed.

That background maps closely to the problems CoW Protocol is solving in off-chain services, order flow, developer-facing APIs, and reliable settlement paths. The core engineering pattern is familiar to me: preserve correctness under changing blockchain conditions, expose clean APIs over complex protocol behavior, build systems that degrade safely, and make execution outcomes understandable to users and integrators.

I also bring hands-on Solana protocol and Rust/Anchor experience. In my Cocos Solana MWA demo game, I used Anchor and Rust to write wins and losses on-chain, connecting game state, wallet approvals, and program execution into one working flow. More broadly, I built Agentic, a non-custodial signing layer for Solana AI agents, and authored multiple Solana Mobile Wallet Adapter SDKs, including the first Cocos Creator MWA SDK and a production-ready Unreal Engine 5 MWA plugin. Those projects required low-level transaction handling, wallet approval flows, message and transaction signing, custom serialization, and careful boundaries between user custody and automated execution.

What interests me most about CoW DAO is the combination of deep protocol work and real user impact. CoW Swap, MEV Blocker, and the protocol services behind them sit in a place where backend engineering quality directly changes execution outcomes for DeFi users. I would bring production trading-system experience, Solana/Rust/Anchor familiarity, strong ownership, and a practical understanding of APIs, routing, risk, and wallet-safe execution to the team.

Thank you for your time and consideration. I would be excited to help CoW DAO build the next generation of decentralized trading infrastructure.

Sincerely,

Mathew Stevens
