Fireblocks / Dynamic Hiring Team
Re: Mobile Engineer

Dear Fireblocks / Dynamic Hiring Team,

I am applying for the Mobile Engineer role because Dynamic is building the exact class of infrastructure I have been focused on: secure, developer-first wallet SDKs that let teams add embedded wallet functionality, signing, and blockchain interactions without weakening user control. My recent work combines native mobile wallet flows, SDK API design, Solana signing, and production app ownership.

I built and shipped SolPulse, a live Solana trading platform with 350+ users, an Android app, Solana dApp Store listing, and Solana Seeker / Seed Vault signing support. SolPulse combines token discovery, automated execution, multi-DEX routing, priority fees, smart TP/SL exits, real-time logs, token intelligence, and risk controls while keeping wallet signing user-controlled. Building it gave me direct experience with reliable mobile wallet UX, transaction approval state, onchain execution, and production behavior when real users and capital are involved.

I also built Agentic, a deployed Solana agent-wallet app where AI agents prepare wallet actions and users approve through their own wallets. It includes MCP tools, a Wallet Standard browser backend, Vercel AI tools, a Solana Agent Kit adapter, approval polling, message signing, transaction signing, sign-and-send, and simulation. The point is similar to Dynamic: make powerful wallet functionality easy for developers to integrate without forcing private keys into app servers, env vars, or embedded signers.

The strongest match is my SDK and Solana Mobile Wallet Adapter work. I have built integration infrastructure across Unreal Engine 5, Cocos Creator, Capacitor, iOS, Godot, and Unity, including TypeScript APIs, native Android bridges, C++ JNI surfaces, encrypted wallet association, auth caching, wallet picker flows, deeplink signing, SIWS-style approval, sample apps, demos, and documentation. I verified flows on Solana Seeker hardware across Phantom, Solflare, Backpack, Jupiter, and Seed Vault.

Before Solana, I worked as an Analytics Specialist / Data Analyst at Socket Mobile, where I built production reporting workflows and worked cross-functionally with technical and business teams. That background helps me care not only about code, but about adoption: clear APIs, useful examples, accurate docs, and integrations customers can maintain.

I would be excited to bring shipped wallet products, mobile SDK engineering, secure signing flow experience, and founder-level ownership to Dynamic at Fireblocks. I can point to live products and open-source infrastructure I built end to end, and I would welcome the chance to discuss how that maps to your mobile SDK roadmap.

Sincerely,

Mathew Stevens
