Datadog - Senior Software Engineer, AI Code Gen - Agent Engineer

Dear Datadog hiring team,

I am excited about the Senior Software Engineer, AI Code Gen - Agent Engineer role because AI coding systems are becoming part of the real engineering loop. The hard part is not just generating code; it is giving agents the right context, making tool use observable, validating results, preserving developer ownership, and connecting agent behavior to the operational truth of production systems. Datadog is one of the best places to build that layer.

My strongest relevant project is Agentic, a non-custodial signing layer for AI agents. Agents can prepare actions, but the user's real wallet remains the approval boundary. It includes MCP tools, Vercel AI tools, a Solana Agent Kit adapter, structured schemas, approval polling, transaction/message signing, and a shared WalletBackend abstraction. That work forced me to think carefully about agent intent, tool boundaries, auditability, failure states, and how to make automated actions safe enough for users to trust.

I also built SolPulse, a production Solana trading platform with 350+ users, real-time dashboards, execution logs, APIs, PostgreSQL/Redis, WebSockets/SSE, and reliability requirements around live capital. When software affects live user decisions, logs, state visibility, and fast debugging are not optional; they are the product. That perspective maps directly to Datadog's strength in observability and developer workflows.

I would bring Datadog practical agent-building experience, full-stack production engineering, TypeScript/backend depth, and a bias toward tools that help developers move faster without hiding system behavior. I am especially interested in building AI coding workflows that are useful, inspectable, measurable, and grounded in how engineers actually debug and ship software.

Best,
Mathew Stevens
