Glean Hiring Team

Re: Founding Forward Deployed Engineer

Dear Hiring Team,

I am excited to apply for Glean's Founding Forward Deployed Engineer role because it sits exactly where I do my best work: translating messy, high-value workflows into production software, then turning what works into a reusable product surface. Glean's Work AI platform is compelling because it is not just a chat interface on top of enterprise data. It is search, context, connectors, APIs, governance, and agentic execution coming together inside the tools where people already work.

My background maps closely to that. I built SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It required real-time execution, WebSockets/SSE, PostgreSQL/Redis, wallet-safe signing, dashboards, mobile flows, and production reliability around live capital. I also built Agentic, a non-custodial signing layer for AI agents on Solana, where an agent can prepare an action but the user's real wallet remains the approval boundary. It includes MCP tools, Vercel AI tools, a Solana Agent Kit adapter, approval polling, transaction/message signing, and a shared WalletBackend abstraction across agent surfaces.

That experience is relevant to Glean because forward-deployed engineering is not just implementation support. It requires enough product sense to find the real problem, enough technical depth to build the first version quickly, and enough engineering judgment to avoid fragile one-off systems. I have done that in domains where latency, trust, and correctness matter, and I enjoy the customer discovery loop that turns a specific workflow into a platform capability.

I would bring Glean high-agency full-stack engineering, agent workflow experience, API and developer-tool judgment, and a practical bias toward shipping useful software quickly. The part of this role that stands out most is the chance to build new product surfaces with founder-level ownership while staying close to strategic customers and the core engineering team.

Sincerely,

Mathew Stevens
