Goldsky Team

Dear Goldsky Team,

I am applying for the Growth Engineer role because Goldsky is working at a point I understand well: turning difficult onchain infrastructure into product surfaces that financial teams can actually use. The mix of stablecoin data infrastructure, AI-powered workflows, customer-facing demos, and growth systems is a strong fit for how I build.

I built and operate SolPulse, a live Solana trading platform across web, iOS, Android, and the Solana dApp Store with 350+ users. It runs on a TypeScript/React/Node stack with PostgreSQL, Prisma, Redis, WebSockets, SSE, multi-DEX routing, priority-fee controls, and real-time token intelligence. The system depends on external data feeds, careful state handling, and practical reliability decisions around live capital. That maps closely to Goldsky's world: abstracting away chains, RPCs, indexing, reorgs, latency, and accuracy so customers can focus on the financial product they are trying to ship.

A second part of my background is agentic automation. I built Agentic, a non-custodial signing layer for Solana AI agents where the agent prepares an action and the user's real wallet approves it. One WalletBackend contract powers MCP tools, Vercel AI tools, and a Solana Agent Kit adapter, with signing, approval polling, and tool interfaces designed around real workflows. That experience fits the role's mandate to build AI-powered internal tools, account research workflows, knowledge agents, onboarding helpers, and automations that save a small team serious time.

Goldsky's growth engineering surface also lines up with my analytics background. Before moving fully into engineering, I spent more than three years at Socket Mobile owning web analytics end to end: collection, QA, dashboards, analysis, A/B tests, and multivariate testing. I am comfortable connecting product behavior to business questions, instrumenting the right events, separating signal from noise, and building the operational tooling that lets a team double down on what is actually working.

Beyond those products, I have shipped SDKs and plugins across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS wallet flows, including first-of-their-kind Solana Mobile Wallet Adapter tooling verified on Solana Seeker hardware. That work required the same instincts Goldsky needs for demos, playgrounds, integration accelerators, and technical content: make hard infrastructure feel usable, explain it clearly, and remove friction for the next developer or customer.

I would bring Goldsky a rare mix of production crypto engineering, full-stack TypeScript execution, AI workflow experience, and growth analytics judgment. I would be excited to help build the automations and product surfaces that make Goldsky grow faster with a small, sharp team.

Sincerely,

Mathew Stevens
