Honeycomb.io - Senior Software Engineer - AI Intelligence

Dear Honeycomb hiring team,

I am excited about the Senior Software Engineer - AI Intelligence role because Honeycomb is building AI where it can matter most: inside real observability workflows. Canvas, the Honeycomb MCP server, Canvas Agent, and Canvas Skills are compelling because they are not generic chat surfaces. They are agentic product experiences that investigate, reason, and act on real production telemetry, where user trust depends on accuracy, UX, and reliability.

I have been building in that same direction. I built Agentic, a non-custodial signing layer for AI agents where agents prepare actions but the user's real wallet remains the approval boundary. It includes MCP tools, Vercel AI tools, a Solana Agent Kit adapter, approval polling, structured schemas, wallet-backed execution, and a shared abstraction that lets multiple agent surfaces use the same signing backend. The core product challenge was making AI actions useful without allowing the agent to bypass human approval or hide what it was doing.

I also built SolPulse, a live Solana trading platform with 350+ users, full-stack dashboards, real-time execution, WebSockets/SSE, PostgreSQL/Redis, production APIs, and reliability requirements around live capital. That product gave me strong instincts around frontend UX under pressure: users need clear state, fast feedback, logs they can trust, and product flows that do not collapse when real-time systems get messy.

The AI Intelligence role is a strong fit because it leans into React/TypeScript product ownership, supporting backend work, agent infrastructure, MCP, production ownership, and evaluation-minded AI product development. I would bring hands-on experience with agent workflows, developer tools, real-time systems, and user-facing product surfaces where trust matters. I like building AI features that are grounded in real workflows, measurable outcomes, and clear interfaces rather than novelty.

Best,
Mathew Stevens
