LaunchDarkly - Full Stack Engineer, AgentControl

Dear LaunchDarkly hiring team,

I am excited about the Full Stack Engineer, AgentControl role because production agents need control planes. As teams move agents into real workflows, they need ways to configure behavior, benchmark outcomes, observe failures, manage rollout, and keep humans in control of high-impact actions. LaunchDarkly's focus on controlling, monitoring, and optimizing agents across the software development lifecycle is exactly the right framing.

I have been building in that direction. Agentic is a non-custodial signing layer for AI agents where agents can prepare actions but the user's real wallet remains the approval boundary. It includes MCP tools, Vercel AI tools, structured schemas, approval polling, transaction/message signing, and wallet-backed execution. The product forced me to think deeply about agent state, user intent, failure modes, auditability, and how to expose powerful actions without making the system opaque or unsafe.

I also built SolPulse, a production Solana trading platform with 350+ users, real-time execution, dashboards, APIs, WebSockets/SSE, PostgreSQL/Redis, execution logs, and reliability requirements around live capital. That experience maps well to AgentControl's need for scalable backend services, full-stack product surfaces, data flow, observability, and ownership of production systems. When users are relying on a system live, clear state and fast debugging are part of the product.

I would bring LaunchDarkly hands-on agent workflow experience, full-stack TypeScript/backend engineering, real-time systems experience, and product judgment around AI control surfaces. I am interested in building the kind of infrastructure that lets teams adopt agents without losing discipline around evaluation, reliability, rollout, and human oversight.

Best,
Mathew Stevens
