LaunchDarkly - SDK Software Engineer, AI

Dear LaunchDarkly hiring team,

I am excited about the SDK Software Engineer, AI role because SDKs are where developer trust is earned. LaunchDarkly's AI Configs work is compelling because it is not just exposing a thin client wrapper; it is building the primary interface developers will use to control, monitor, and optimize GenAI functionality in production. That requires SDKs that are idiomatic, resilient, performant, observable, and pleasant to use across real application environments.

My background maps directly to that. I built Agentic, a non-custodial signing layer for AI agents on Solana. It includes MCP tools, Vercel AI tools, a Solana Agent Kit adapter, structured schemas, approval polling, transaction/message signing, and a shared WalletBackend abstraction. The core design problem was making agent actions useful while preserving clear user approval boundaries and a clean developer interface.

I have also shipped developer-facing SDK and plugin work across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS wallet flows. That work taught me how much SDK quality depends on small details: examples, runtime-specific idioms, error states, concurrency, versioning, docs, and whether developers can debug the integration without guessing. SolPulse, my live Solana trading platform with 350+ users, added production reliability experience across APIs, WebSockets/SSE, PostgreSQL/Redis, dashboards, and wallet-safe execution.

I would bring LaunchDarkly strong TypeScript product engineering, AI SDK experience through Vercel AI tools and MCP, production API judgment, and a practical instinct for open-source developer surfaces. I am especially interested in helping make AI feature rollout feel controlled and observable, so teams can ship GenAI systems with the same discipline they expect from the rest of their software delivery lifecycle.

Best,
Mathew Stevens
