Morpho Team

Dear Morpho Team,

I am applying for the Staff Fullstack Engineer role because Morpho is building the kind of open financial infrastructure I want to work on: a product surface around onchain capital where reliability, performance, developer experience, and correctness all matter. A lending protocol with more than \$10B in deposits needs engineering that treats the frontend, APIs, indexers, SDKs, and observability as one system.

I built and operate SolPulse, a live Solana trading platform across web, iOS, Android, and the Solana dApp Store with 350+ users. It includes a real-time execution engine, WebSockets/SSE, PostgreSQL, Prisma, Redis, multi-DEX routing, priority-fee controls, token intelligence, and layered risk systems around live capital. Owning that system end to end has made me practical about financial product engineering: users need fast interfaces, but the important work is often state consistency, failure handling, observability, and making sure a single bad signal cannot bypass risk limits.

The onchain data side of SolPulse maps especially well to Morpho's product architecture needs. I built 35 intelligence pillars for token scoring and risk, including smart-money and whale tracking, dev-identity checks, rug scanning, and regime-aware signals. The platform integrates multiple data providers and turns noisy chain activity into product decisions under tight latency constraints. Morpho's GraphQL APIs, REST surfaces, data indexers, caching, and real-time streaming systems are a different protocol surface, but the engineering shape is familiar: reliable interpretation of chain events, fast queries, and APIs that integrators can build on.

I also built Agentic, a non-custodial signing layer for Solana AI agents where one WalletBackend contract powers MCP tools, Vercel AI tools, and a Solana Agent Kit adapter. Alongside it, I have shipped SDKs and plugins across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS wallet flows, including first-of-their-kind Solana Mobile Wallet Adapter tooling verified on Solana Seeker hardware. That experience is directly relevant to Morpho's API and SDK strategy: versioned abstractions, clear developer surfaces, typed interactions, and integration paths that reduce support burden instead of creating it.

My deepest protocol work has been in Solana rather than EVM, but the core problems I have solved are the ones Morpho is scaling: product architecture around onchain state, high-reliability systems for financial users, developer tooling for integrators, and fast full-stack delivery without a rigid playbook. I can get up the Morpho-specific and EVM-specific curve quickly because I have already had to own the full path from wallet to transaction to data layer to user-facing workflow.

I would be excited to help Morpho scale its product suite and build the technical foundations that make open lending feel fast, trustworthy, and easy for integrators to adopt.

Sincerely,

Mathew Stevens
