PlanetScale Hiring Team

Re: Software Engineer - PlanetScale Postgres

Dear PlanetScale Hiring Team,

I am excited to apply for the Software Engineer - PlanetScale Postgres role. PlanetScale's managed Postgres work is the kind of infrastructure engineering I care about: building systems where provisioning, scaling, replication, failover, backup, restore, and operational recovery become reliable enough that product teams can move faster without treating their database as a constant source of risk.

My background is full-stack engineering with a strong production systems and reliability focus. I built and operate SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. The platform uses PostgreSQL/Redis, real-time execution, WebSockets/SSE, production APIs, execution logs, dashboards, deploys, rate-limit handling, and monitoring around live capital. That work forced me to build with correctness, latency, observability, data integrity, and operational recovery in mind, because issues in the database or control path directly affect users and financial workflows.

What draws me to this role is the control-plane and managed-service side of Postgres. I like systems where automation has to encode real operational judgment: when to scale, how to recover, how to protect data, how to reduce customer-visible downtime, and how to expose enough context for both engineers and customers to trust the platform. I have not only built product surfaces on top of databases, but also owned the practical work around production APIs, deployment behavior, logs, queue-like workflows, and customer-impacting reliability.

I would also bring strong developer-tooling and API judgment. I built Agentic, a non-custodial signing layer for AI agents, with MCP tools, Vercel AI tools, a Solana Agent Kit adapter, approval polling, transaction signing, and a shared WalletBackend abstraction. I have also built SDKs and plugins across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, native iOS, and mobile wallet flows. That work maps well to platform engineering because it requires clear contracts, careful edge-case handling, and an instinct for making complex infrastructure usable by developers.

PlanetScale stands out because it is building serious database infrastructure with a developer experience that still feels product-minded. I would be excited to help build and operate the managed Postgres platform that customers can trust for demanding production workloads.

Sincerely,

Mathew Stevens
