Postman - Member of Technical Staff, AI Agent Development Lead

Dear Postman hiring team,

I am excited about the Member of Technical Staff, AI Agent Development Lead role because Postman is already where developers define, test, debug, and understand APIs. The next step for agentic software is not a generic chat surface; it is structured execution over real tools, APIs, auth, schemas, state, and observable results. Postman is unusually well positioned to make that practical for developers.

My recent work is directly aligned with that problem. I built Agentic, a non-custodial signing layer for AI agents on Solana. An agent can prepare a transaction or message, but the user's real wallet remains the approval boundary. It includes MCP tools, Vercel AI tools, a Solana Agent Kit adapter, structured schemas, approval polling, transaction/message signing, and a shared WalletBackend abstraction across agent surfaces. The core product challenge was making agents useful while keeping actions inspectable, bounded, and human-approved.

I also built SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It includes production APIs, real-time execution flows, dashboards, PostgreSQL/Redis, WebSockets/SSE, wallet-safe signing, and reliability requirements around live capital. That experience gave me strong instincts for agent and API systems where state, latency, failure modes, and user trust matter.

I would bring Postman hands-on agent infrastructure experience, full-stack product engineering, strong TypeScript/API judgment, and a developer-tools mindset from shipping SDKs/plugins across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS flows. I am interested in helping Postman make AI agents something developers can build, test, inspect, and trust in real workflows.

Best,
Mathew Stevens
