Postman - Senior Software Engineer, Ecosystem

Dear Postman hiring team,

I am excited about the Senior Software Engineer, Ecosystem role because API tooling becomes most valuable when it connects cleanly with the rest of a developer's workflow: SDKs, auth, testing, docs, integrations, agents, internal tools, and production debugging. Postman's ecosystem surface area is exactly where thoughtful API design and practical integration work can compound for millions of developers.

My background is deeply developer-tools oriented. I built Agentic around one shared WalletBackend contract that powers MCP tools, Vercel AI tools, a Solana Agent Kit adapter, approval polling, transaction/message signing, and wallet-backed execution without duplicating core logic. The goal was to turn a complex signing and trust problem into a clean interface that multiple developer surfaces could use safely.

I also built SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It includes production APIs, real-time dashboards, PostgreSQL/Redis, WebSockets/SSE, execution logs, wallet-safe signing, and reliability requirements around live capital. Across SDK/plugin work, I have built developer-facing integrations across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS flows, including demos, docs, examples, and native bridges.

I would bring Postman strong full-stack engineering, API design judgment, and direct experience building tools across multiple ecosystems where developers need clear abstractions and reliable behavior. I like product engineering where the complexity is real, but the developer experience feels simple, and that is exactly why Postman's ecosystem work stands out to me.

Best,
Mathew Stevens
