Runpod Hiring Team

Re: Software Engineer (Full-Stack)

Dear Runpod Hiring Team,

I am excited to apply for the Software Engineer (Full-Stack) role at Runpod. The role sits at a strong intersection for me: AI infrastructure, developer-facing APIs and SDKs, full-stack product work, and scalable systems that need to feel simple to the engineers and researchers using them. Runpod's focus on cloud infrastructure for AI applications is especially compelling because the developer experience around compute, deployment, and integration is becoming one of the most important layers in the AI stack.

My background maps well to that work. I built and operate SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It includes React/TypeScript product surfaces, backend APIs, PostgreSQL/Redis, WebSockets/SSE, dashboards, execution logs, deploys, monitoring, and reliability constraints around live capital. That required moving comfortably between frontend UX, backend correctness, real-time data, and production operations.

I have also built a substantial set of developer-facing tools and SDKs. My Solana Mobile Wallet Adapter work spans Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS flows, including plugins, example apps, docs, native bridges, wallet signing flows, and open-source contributions. I care about SDKs that are intuitive because I have been on the hook for the entire path: API design, integration friction, debugging, documentation, and developer support.

Most recently, I built Agentic, a non-custodial signing layer for AI agents. It includes MCP tools, Vercel AI tools, a Solana Agent Kit adapter, approval polling, message and transaction signing, and a shared WalletBackend abstraction across agent surfaces. That work is directly connected to the kind of AI infrastructure Runpod is building: making powerful technical systems accessible through clean APIs, clear integration paths, and reliable execution behavior.

I would bring Runpod strong TypeScript and backend product engineering experience, a practical sense for developer tools, and production reliability judgment from operating systems where latency, correctness, and user trust matter. I would be excited to help build the tools, APIs, and open-source SDK experience that make Runpod easier and more powerful for AI engineers.

Sincerely,

Mathew Stevens
