Scale AI - Frontier Agents Engineer

Dear Scale AI hiring team,

I am excited about the Frontier Agents Engineer role because it sits where agent systems become real: customer data, internal APIs, production deployment, evaluation, human-in-the-loop workflows, and practical business outcomes. The role's focus on architecting custom AI solutions, integrating with customer environments, building production agents, and turning repeated deployment patterns into product improvements is a strong match for how I like to work.

My strongest relevant project is Agentic, a non-custodial signing layer for AI agents on Solana. Agents can prepare transactions or messages, but the user's real wallet remains the approval boundary. It includes MCP tools, Vercel AI tools, a Solana Agent Kit adapter, structured schemas, approval polling, transaction/message signing, and a shared WalletBackend abstraction. That project required careful thinking about tool use, state, permissions, human approval, and how to make agent actions inspectable when the outcome matters.

I also built SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It includes production APIs, dashboards, PostgreSQL/Redis, WebSockets/SSE, real-time execution flows, wallet-safe signing, and reliability requirements around live capital. Building and operating SolPulse gave me practical experience debugging across the stack, handling ambiguous product requirements, making real-time state visible, and building systems users could trust outside a demo.

I would bring Scale AI hands-on agent infrastructure experience, strong full-stack engineering, API and data-flow judgment, and customer-facing technical communication from SDK/plugin work across Cocos, Unreal, Godot, Unity, Capacitor, and iOS. I am especially interested in building agents that are measurable, integrated into real workflows, and grounded in feedback loops that make them better over time.

Best,
Mathew Stevens
