Sourcegraph - Software Engineer - Code Understanding

Dear Sourcegraph hiring team,

I am excited about the Software Engineer - Code Understanding role because Sourcegraph is working on the layer that both developers and agents need next: reliable understanding of large, complex codebases. Code Search, Deep Search, Code Intel, Code Review, MCP, and agent-powered documentation are not side features; they are becoming the way engineers navigate unfamiliar systems and keep quality high as AI writes more code.

My background is a strong fit for that direction. I built Agentic, a non-custodial signing layer for AI agents with MCP tools, Vercel AI tools, a Solana Agent Kit adapter, structured schemas, approval polling, transaction/message signing, and wallet-backed execution. The system is built around a simple but important principle: agents can accelerate work, but the engineer or user still has to understand, approve, and own the outcome. That same principle applies to AI coding tools and code review.

I also built SolPulse, a production Solana trading platform with 350+ users, full-stack dashboards, APIs, PostgreSQL/Redis, WebSockets/SSE, execution logs, wallet-safe signing, and reliability requirements around live capital. Building and operating that product required exactly the kind of codebase understanding that Sourcegraph improves: tracing behavior across services, working through frontend/backend boundaries, debugging production issues, and making changes without losing context.

Across SDK and developer-tooling work, I have built integrations across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS wallet flows. That gave me a lot of empathy for developers trying to understand unfamiliar APIs, sample code, and cross-language systems. I would bring Sourcegraph strong TypeScript/product engineering, practical agent workflow experience, and a clear respect for the fact that AI-generated code still needs to be readable, reviewable, and operated by humans.

Best,
Mathew Stevens
