Sourcegraph - Field Engineer

Dear Sourcegraph hiring team,

I am excited about the Field Engineer role because Sourcegraph sits at the center of a real shift in how software teams build, review, migrate, and understand code. AI coding tools only create durable value when they fit into an organization's actual SDLC: repositories, reviews, security constraints, developer workflows, platform migrations, and the messy edges of large codebases. That is exactly where a strong field engineer can make a difference.

My background combines production engineering, developer tooling, and customer-facing technical communication. I built Agentic, a non-custodial signing layer for AI agents with MCP tools, Vercel AI tools, a Solana Agent Kit adapter, structured schemas, approval polling, and wallet-backed execution. It required designing a technical architecture, explaining the trust model, debugging integrations, and helping developers understand how agent actions should be bounded and approved.

I also built SolPulse, a live Solana trading platform with 350+ users, real-time dashboards, APIs, WebSockets/SSE, PostgreSQL/Redis, execution logs, wallet-safe signing, and reliability requirements around live capital. Running a product like that builds useful field judgment: you learn to diagnose issues across the stack, separate symptoms from root causes, communicate tradeoffs clearly, and keep users moving when the system matters.

Across SDK work, I have shipped plugins and integrations across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS flows. That experience maps well to Sourcegraph's customer-facing work: understanding a technical environment, identifying developer friction, building examples or workflows that solve the real problem, and feeding product insights back to engineering. I would bring Sourcegraph a mix of AI-agent literacy, implementation depth, developer empathy, and the ability to earn trust with technical teams by being useful quickly.

Best,
Mathew Stevens
