Tailscale - Developer Relations Engineer

Dear Tailscale hiring team,

I am excited about the Developer Relations Engineer role because Tailscale is the kind of deeply technical product that succeeds by making difficult infrastructure feel simple. Secure connectivity, identity, privileged access, developer tooling, and secure AI access are hard domains; the best developer experience work turns those concepts into clear examples, usable demos, strong docs, and patterns that engineers can trust in production.

My background sits naturally at that intersection of engineering and developer communication. I built Agentic, a non-custodial signing layer for AI agents with MCP tools, Vercel AI tools, a Solana Agent Kit adapter, approval polling, structured tool schemas, and wallet-backed execution. The product problem was both technical and educational: how do you let agents initiate useful work while keeping the user's real wallet as the security boundary, and how do you explain that clearly to developers building on it?

I also built SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It includes real-time execution, WebSockets/SSE, PostgreSQL/Redis, dashboards, production APIs, wallet flows, and reliability requirements around live capital. Beyond that, I have built SDKs/plugins across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS, including docs, demos, native bridges, open-source PRs, and integration examples.

That is why this role stands out. I like building things, breaking them down until the edge cases are clear, and turning the result into assets other developers can actually use: examples, reference architectures, technical writing, videos, sample apps, and public technical conversations. Tailscale's work around secure AI access, infrastructure security, and developer-friendly networking is a strong match for the builder-storyteller profile I would bring to the team.

Best,
Mathew Stevens
