Tailscale - Mobile Platform Developer

Dear Tailscale hiring team,

I am excited about the Mobile Platform Developer role because Tailscale's product depends on the kind of mobile engineering I respect: native platform behavior, secure networking concepts, careful UX, shared cross-platform logic, and reliability that users should not have to think about. Building VPN and connectivity software across iOS, Android, desktop, and backend services is exactly the kind of product/platform boundary that rewards practical engineering judgment.

My strongest mobile experience comes from shipping real products and cross-platform SDK flows. I built SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It includes wallet-safe mobile flows, real-time market and execution data, dashboards, production APIs, WebSockets/SSE, PostgreSQL/Redis, and reliability requirements around live capital. Shipping SolPulse across platforms taught me how much product quality depends on small mobile details: lifecycle behavior, signing UX, latency, failure states, and clear user feedback.

I have also built developer-facing wallet and signing infrastructure across Capacitor, native iOS flows, Unity, Unreal Engine 5, Godot, and Cocos. That work required designing shared abstractions while still respecting what each runtime and platform does differently. I am comfortable crossing product, API, native bridge, and backend boundaries to make a platform feel coherent to users and developers.

I would bring Tailscale strong cross-platform product engineering, Swift/iOS exposure, mobile wallet/security experience, real production ownership, and a track record of learning platform edges deeply enough to ship. Tailscale's mix of Swift, Kotlin, Go, mobile networking, and secure client behavior is a role where that breadth would be useful from day one.

Best,
Mathew Stevens
