Together AI Hiring Team

Re: Senior Developer Productivity Engineer

Dear Together AI Hiring Team,

I am excited to apply for the Senior Developer Productivity Engineer role at Together AI. What stands out to me is the leverage of the work: building the systems, tooling, local environments, CI/CD patterns, and documentation that let engineers spend less time fighting infrastructure and more time shipping high-quality AI infrastructure. Together AI's mission to lower the cost of modern AI systems through co-design across software, hardware, algorithms, and models is exactly the kind of environment where developer productivity work has outsized impact.

My background is a strong fit because I have repeatedly built production systems and developer tools where reliability, speed, and clarity matter. I built and operate SolPulse, a live Solana trading platform with 350+ users across web, iOS, Android, and the Solana dApp Store. It includes real-time execution, WebSockets/SSE, PostgreSQL/Redis, production APIs, wallet-safe signing, logging, deploys, rate-limit handling, and reliability requirements around live capital. Owning that system end to end has made me pragmatic about build/deploy workflows, observability, local debugging, and the engineering cost of unclear tooling.

I also built Agentic, a non-custodial signing layer for AI agents where the agent prepares an action and the user's real wallet approves it. One shared WalletBackend abstraction powers MCP tools, Vercel AI tools, and a Solana Agent Kit adapter, with approval polling, transaction/message signing, sign-and-send flows, and structured tool surfaces. That work is directly adjacent to developer productivity: designing reusable abstractions, keeping integrations consistent, making agent behavior inspectable, and giving developers a path from idea to working integration without rewriting the core system.

Beyond those products, I have shipped SDKs and plugins across Cocos, Unreal Engine 5, Godot, Unity, Capacitor, and native iOS wallet flows, including open-source contributions merged upstream. That work required the same instincts Together AI is hiring for: build reusable tooling, reduce setup friction, document the path clearly, handle platform differences, and create examples teams can rely on. I am strongest in TypeScript/Node/React systems, APIs, CLI/tooling-style workflows, SQL-backed services, and production debugging, with enough Python and infrastructure experience to work effectively across automation and enablement surfaces.

I would bring Together AI a builder mindset, high ownership, and a practical focus on the developer experience inside the engineering organization. I like turning repeated pain into durable tools, reducing build and deployment friction, and creating simple workflows that hold up under production pressure. I would be excited to help Together AI engineers move faster while keeping the systems underneath reliable, observable, and easy to use.

Sincerely,

Mathew Stevens
